Possible Additional Reviewers:

Page _____ Line _____ Comments: (use additional pages if needed)

This paper provide an fundamental data on the formation of alternating copolymer of S and MA, but is not suitable as a full paper for the publication in Macromolecules from the following reasons:

- 1) Experimental data is not much enough to make a conclusion on the formation of the alternating copolymer from the MA and S copolymerization system.
- 2) Special devise has not been found in experimental technique and analysis of the data.

The introduction and discussion should be written more concisely, and Tables and Figures should be rewritten more clearly along with Captions. The paper should be resubmitted as a note.

I think this paper is not suitable for the publication at the present time.
